

## CLIMATE CHANGE HYSTERICS

6<sup>th</sup> November  
The Editor,  
"The Australian",

Dear Sir,

First, congratulations to your newspaper for continuing to print opinions from all sides on various important issues. I particularly enjoyed Janet Albrechtsen's thought-provoking comments on the "climate change hysterics" in Wednesday's edition, which prompts me to write to you.

Every day, the "Australian" publishes an excellent full-page summary of the weather forecasts around the country. The page also includes some interesting statistics about the record high and low temperatures, rainfall, etc. for each of the Australian capital cities, and I have been following these for some considerable time.

Given the shrill, alarmist nature of many of those predicting "Armageddon" because of the so-called man-made climate change/global warming activities, am I the only one who has observed that the record "high" temperatures for each capital city each day is, often as not, 30-50, or 80-100, etc. years or more ago? It could prove quite interesting if someone undertook a statistical analysis of the data.

Yours sincerely,

**Peter N. Jamieson**
