

## The Role of Carbon Dioxide in Climate Change

07.02.2010

The Editor

In The Australian on Friday February 6, there were six Letters to the Editor discussing the various roles of trees, the Carbon Pollution Reduction Scheme, bio-char and soil sequestration, the growing of crops and coal-fired power stations in changing the climate. All of these discussions were based on the need to reduce carbon dioxide from our environment, predicated on the assumption that carbon dioxide is the cause of any climate change that is occurring. Have none of these correspondents been reading any of the recent information freely available on the Internet and elsewhere that has shown that carbon dioxide is not a prime cause of climate change? For how long must we endure this inane barrage of solutions to a problem that doesn't exist instead of just addressing how to cope with any climate change that does occur?
